Utilizing Passage Sets for Bypassing Closet Doors

Passage sets offer a versatile solution for various sliding door applications, seamlessly combining both edge and face pulls. This adaptability is especially valuable for bypass closet doors, where a single passage set can be efficiently distributed between the two doors. This setup equips each door with a flush pull, while the rear door gains the added convenience of an edge pull. This configuration ensures smooth functionality, by providing easy access to the rear door when the doors are stacked.
